

The Buyer's 3-Step Setup Process

You will include these simple steps in the user guide bundle you upload to **Selar**:

1. **Make a Copy of the Spreadsheet:** The buyer clicks your master Google Sheets link and clones a private copy into their own Google Drive account.
 2. **Generate Their Deployment URL:** Inside *their* copy of the sheet, they open **Extensions > Apps Script**, paste your free unlimited script, and hit **Deploy as Web App** (setting access to *Anyone*).
 3. **Paste the Link into the App:** The buyer copies the long Google Web App URL they just created, goes to your live Netlify web application link, and pastes it into the **Database Setup** box.
-

Why This Setup is a Seamless Experience for the Buyer

- **They Only Do It Once:** The buyer does not have to paste this long link every single time they log an invoice. Thanks to the `localStorage` logic we added to the code, the web app safely remembers their unique database URL link in their phone or computer browser memory forever.
- **100% Code Privacy:** Because the URL belongs to *their* Google account, their income logs, client names, and tax numbers are 100% private. None of their sensitive financial data ever passes through you or any third-party company.
- **It Works Everywhere:** Once they save it, they can add your web app as a custom icon on their phone's home screen. Every time they open it, it is immediately ready to log transactions straight into their personal spreadsheet.
